## ABSTRACT OF THE DISCLOSURE

In correcting the sound field, loudspeakers  $\theta_{\text{FL}}$  to  $\theta_{\text{WF}}$ are sounded by the noise. The attenuation factors of the inter-band attenuators  $ATF_{11}$  to  $ATF_{ki}$  for adjusting gains of the band-pass filters  $\mathtt{BPF}_{11}$  to  $\mathtt{BPF}_{ki}$  to the frequency in respective channels are corrected based on detection results of the reproduced sounds of the loudspeakers  $6_{FL}$  to  $6_{WF}$ . attenuation factors of channel-to-channel attenuators ATG1 to ATG<sub>5</sub> are corrected based on the detection results of the reproduced sounds of the loudspeakers  $6_{FL}$  to  $6_{WF}$ . The delay times of delay circuits  $\mathrm{DL}Y_1$  to  $\mathrm{DL}Y_5$  are corrected based on the detection results of the reproduced sounds of the loudspeakers  $6_{\rm FL}$  to  $6_{\rm WF}$ . The attenuation factor of a channel-to-channel attenuator  $\mathtt{ATG}_k$  is corrected based on the detection result of the reproduced sound of the loudspeaker  $\theta_{WF}$  as the subwoofer. Therefore, the levels of the reproduced sounds reproduced by the loundspeakers  $6_{\text{FL}}$  to  $6_{\text{WF}}$  are adjusted to be made flat over the audio frequency band.
